SparkSession: Prior to Spark 2.X, there were different entry points for different Spark jobs; that is, for Spark SQL we had `sqlContext` and if Hive features were also required then `HiveContext` was the entry point. With Spark 2.X this ambiguity has been removed and now we have one single entry point called `SparkSession`.

When `_` is used on its own it represents an argument in the anonymous function. So if we working on pairs: `map(_. _2 + _. _2)` would be shorthand for `map(x, y => x._2 + y._2)`. When `_` is used as part of a function name (or value name) it has no special meaning. In this case `x._2` returns the second element of a tuple
