IHAC that has just tested performance of the ECS with F5 Loadbalancer. Without F5 the performance is good, because the client can do multiple transaction without creating a new session for each transaction. To get the load balancing done by F5, every transaction needs a new session and this slows down the performance.

I am going round and round with my network/F5 team over this implementation. They do not want to put an ECS (the data interfaces in a network segregated setup) on a network "behind" the LTM (F5 becomes the default gateway). They say the ECS data interfaces should be on whatever network and the F5 can be on whatever network and the F5 will SNAT.

Dell EMC ECS is an object storage solution developed by Dell EMC. It uses hardware 'nodes' to provide storage and is designed to be flexible, resilient, and simple to deploy. Dell recommends the use of load balancing in an ECS deployment, in order to distribute the inbound workload across all ECS nodes in an effort to maximize performance.
