Gravitational Waves

In principle, gravitational lensing of gravitational waves (GWs) should occur in the same way as it does for light (Thorne 1987). However, there are some key differences that can potentially favor the observation of such lensing over that of light. The most obvious difference is that dust

luminous matter. Dark Matter has thus far been an extremely difficult subject to study given that until now, it has been very difficult to directly investigate.

Gravitational waves allow for solutions to this - one of these is by examining the phenomenon of Gravitational Lensing.

The gravitational lensing of gravitational waves might cause beat patterns detectable by interferometers. The feature of this kind of signal is the existence of the beat pattern in the early inspiral phase, followed by a seemingly randomly changing profile.

...

A gravitational lens is a distribution of matter between a distant light source and an observer, that is capable of bending the light from the source as the light travels towards the observer. This effect is known as gravitational lensing, and the amount of bending is one of the

This effect is known as gravitational microlensing. The simplest type of gravitational lensing occurs when there is a single concentration of matter at the center, such as the dense core of a galaxy. The light of a distant galaxy is redirected around this core, often producing multiple images of the background galaxy.
