Introduction Machine learning is a subfield of artificial intelligence (AI). The goal of machine learning generally is to understand the structure of data and fit that data into models that can be understood and utilized by people. Although machine learning is a field within computer science, it differs from traditional computational approaches.

An Introduction to Machine Learning | DigitalOcean

Machine learning (ML) is an art of developing algorithms without explicitly programming. In the past two decades, exabytes of data has been generated and most of the industries have been fully digitized. This existing data is used by Machine learning (ML) algorithms to develop predictive models and automate several time-consuming tasks.

Machine learning identifies patterns using statistical learning and computers by unearthing boundaries in data sets. You can use it to make predictions. One method for making predictions is called a decision trees, which uses a series of if-then statements to identify boundaries and define patterns in the data.
