Lecture 11: Volume Evolution And System Analysis1 Lyapunov analysis, which uses monotonicity of a given function of system state along trajectories of a given dynamical system, is a major tool of nonlinear system analysis. It is possible, however, to use monotonicity of volumes of subsets of the state space to

Lecture 5- The Evolution of Information System Models-Over the past 50 years, a number of different approaches or models have represented accounting information systems. Each new model evolved because of the shortcomings and limitations of its predecessor. An interesting feature in this evolution is that the newest technique does not immediately replace older models.

word for instability. For example, the system  $\dot{x} = x$  is deterministic and shows exponential separation of nearby trajectories. However, we should not consider this system to be chaotic! Trajectories are repelled to infinity, and never return. Hence infinity is a fixed point of the system, and ingredient 1. above specifically excludes fixed points! 18

We saw that volume responses to quality really dampened our ability to improve quality. When we set that quality constant up high, as volume constantly kept on going higher, we could not

get ahead. So, the system improvements that bring quality at a low volume will fail when the volume increases. And that is a property of the system.

Entropy is a scientific concept, as well as a measurable physical property that is most commonly associated with a state of randomness or disorder. The term and the concept are used in diverse fields, from classical thermodynamics, where it was first recognized, to the microscopic description of nature in statistical physics, and to the principles of information theory.
