Each BPEL process you deploy to the Oracle BPEL Process Manager requires a process descriptor. This process descriptor is not covered by the BPEL standard and is specific to the BPEL server. The deployment process descriptor is the only part of the implementation of a process on a given platform that must be re-written to run the process on a different BPEL engine.

## **A Hands-on Introduction to BPEL - Oracle**

A BPEL process is also an XML file, of a specific structure defined by the BPEL standard, and is to be interpreted. So you deploy a composite to the SOASuite infrastructure, that extracts all the components and then target each component to the appropriate engine. In

If you haven't yet install the environment or started the server, go to my previous post Oracle SOA Suite 12c Installation. For this post I've create a SOA application with new project, and selected a BPEL component: I've added a simple assign activity for the example:

# File Type PDF Oracle Soa Bpel Engine Deployment

Now we can deploy the process: Right click the project and deploy it:

## **Create and run a SOA Composite with a simple BPEL process ...**

Any changes only take effect after a reboot of the BPEL server. The wrinkle to this is that when a process is deployed it stores its WSDL using the current soapServerUrl but the BPEL server serves up the location using the soapServerUrl in effect at the time the BPEL engine was started until the BPEL server is rebooted.
